RESEARCH INTEREST

My research interests lie in active state estimation, control generation and machine learning for robotics. I investigate interactive perception, where robots use their manipulation capabilities to gain the most useful perceptual information to model the world and inform intelligent decision making. The paradigm of generating motion to improve state estimation (interactive perception) and task execution (reinforcement learning) has been applied throughout my work, where I show that coupling perception and control together can be beneficial for both fields. More recently, I have been investigating deep reinforcement learning and its applications in robotics. I have evaluated my work on many different platforms including quadrotors, humanoid robots and robotic arms.
